                                                                                                                                                                                                                                                         The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated cancer associated nucleic acids and polypeptides isolated using sera from cancer patients, used to develop profor the diagnosis, monitoring or treatment of cancers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, remal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                           The invention relates to a human colon tumour expressed polynucleotide (I) encoding a polypeptide (II, ABP67991-ABP87996) comprising; (i) any of 2600 fully defined nucleotide sequences (ABV8669-ABV89289); (ii) complements of (i); (iii) at least 20 contiguous residues of (i); (iv) sequences that hybridize to (i), under moderately stringent conditions; (v) sequences having at least 75% or 90% identity to (i); or (vi) degenerate variants of (i). The compositions and methods of the present invention are useful for the diagnosis, prevention and/or treatment of cancer, particularly colon cancer. (I) can be used in gene therapy and (I) and (II) are useful in pharmaceutical compositions such as vaccines. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240
```

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAR19001-T26837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each libraries all the 3'-oriented cDNAs hybridise with specific mRNAs.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC AAH57161 to AAH57576 represent cell and tissue specific polynucleotide CC sequences (I). (I) can have cytostatic, immunomodulatory and concerning the concerning and concerning the concerning the concerning concerning (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptide nucleic acids, commettics, peptides, proteins, agonists, antagonists, antibodies or their fragments, immunoglobulins, inhibitors, drug compounds and compared the concerning concerning the cells into a tissue selected from the concerning the cells into a tissue selected from CC differentiation of embryonic stem cells into a tissue selected from CC tissues. (I) and (II) are used to produce an expression profile that CC disease or disorder. The gene profile can be used for diagnosis, conditioning of treatments and for investigating a produce stem to a disorder where the gene is associated with a concerning that the concerning a disorder where the gene is associated with a concerning that the concerning that concerning the can be used for investigating a concerning that concerning the can be used for investigating a concerning that concerning the can be used for investigating a concerning that concerning the concerning that con

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC functional, and regulatory genes of corn ear. The polynucleotides are useful for detecting code in a sample, for producing CC altered gene expression in inbred or hybrid plants, and for screening CC altered gene expression in inbred or hybrid plants, and for screening CC are useful to identify, isolate, or extend identical or related CC corn-ear nucleic acid sequences from DNA libraries, and in nucleic acid amplification or hybridisation techniques to follow the expression of desirable traits through plant breeding programs. CC preferably, the cdps are used to identify, evaluate, alter, or cc follow the inheritance of desired characteristics associated with CC growth and development, disease resistance, environmental adaptability, CC quality, and yield of corn. The cdps are also useful as molecular CC polypeptides by recombinant techniques. They are also useful in CC diagnostic assays to detect or confirm conditions or diseases CC associated with abnormal levels of cdp expression. ABX81541-ABX89140 CC represent corn ear-derived polymucleotides (cpds) of the invention. CC USPTO web site at sequata.uspro.gov/psipsDIDEntry.html.

                                                                                                                                                                                                                                                                                                                                                                                                                                       CC second nucleic acid molecule comprising any of 15112 nucleotide
CC sequences, appearing as ABX34836-ABX4947, or complements of them.
CC Also included are; (1) a transformed cell having a nucleic acid
CC comprising an IMFD nucleic acid linked to a promoter and a 3' non-
CC translated sequence that functions in the cell to cause termination of
CC transcription and addition of polyadenylated ribonucleotides to a 3' end
CC molecule in a bovine cell or tissue comprising; (a) incubating a marker
CC molecule in a bovine cell or tissue comprising; (a) incubating a marker
CC complement or fragment) with a complementary nucleic acid sequences or its
CC complement or fragment) with a complementary nucleic acid molecule
CC marker nucleic acid and the complementary nucleic acid melecule
CC marker nucleic acid and the complementary nucleic acid melacule;
CC complementary nucleic acid, where the detection of the complementary
CC complementary nucleic acid is used for detecting the level or pattern of the
CC complementary nucleic acid is used for determining a level or pattern
CC of a molecule in a bovine cell or tissue. It is useful for genome
CC mapping, gene identification and analysis, cattle breeding, preparation
CC improving cattle. The present sequence is one of the 15112 bovine

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
The invention relates to a purified nucleic acid molecule associated with CC lactation or muscle and fat deposition (designated LMFD), derived CC from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 15112 nucleotide CC sequences, appearing as ABX34836-ABX4947, or complements of them. CC Also included are; (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a3 non-cc translated sequence that functions in the cell to cause termination of CC transcription and addition of polyademylated ribonucleotides to a 3 end CC molecule in a bovine cell or tissue comprising: (a) incubating a marker CC complement or fragment) with a complementary nucleic acid sequences or its complement from the bovine cell or tissue, where hybridisation between the CC marker nucleic acid and the complementary nucleic acid permits the CC complementary nucleic acid of the molecule; and (b) detection of the complementary nucleic acid permits the CC complementary nucleic acid, where the detection of the molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid associated with lactation, and muscle and deposition, useful for genome mapping, gene identification analysis, cattle breeding, or for genetically improving cat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bovine; ss; EST; expressed sequence tag; muscle deposition; fat deposition; genome gene analysis; cattle breeding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Byatt JC,

It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 15112 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site: sequence.html?DocID=20020137139.
New nucleic acid associated with lactation, deposition, useful for genome mapping, gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene analysis; cattle breeding.

                                                     ABK40018 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) a seful for:

(a) assessing whether a patient is afflicted with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, used for detecting presence of prostate cancer, stage of prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 340

                                                                          8
                                                                                                                                                                                                The invention relates to a nucleic acid comprising a sequence at CC least 18 bases in length of a segment of the chemically pretreated DNA CC of genes associated with pharmacogenomics according to one of the Sequences of the genes ALDH6 (NM 000693), CYP11A (NM 000781), CYP11B1 (CC (NM 000497), CYP3A3 (NM 00776 and NM 017460), DPYD (NM 000110), EPHX2 (NM 001979), OCIN (NM 002538), TXNRDI (NM 003330), UCTB (NM 003360), CC (NM 01979), OCIN (NM 019901, NM 019902, NM 019862, NM 019898, CC (NM 01989) and their complementary sequences, or a sequence (SI) chosen CC from 87 sequences and their complements. The chemical pretreatment CC is bisulphite treatment to convert cytosines (but not methyl-cytosines) into uracils. Also included are an oligomer (II) in particular an CC oligomuclectide or a peptide nucleic acid (PNA)-oligomer, comprising in CC each case at least one base sequence having a length of 9 nucleotides CC which hybridises to or is identical to a chemically pretreated DNA of Genes associated with pharmacogenomics and their complements, arranged in CC can array for analysing diseases associated with the methylation state (CC (CpG) and/or detecting SNPs (single nucleotide polymorphisms) cof the 87 sequences. The oligomers may also be used as PCR primers. CC of the 87 sequence data for this patent did not form part of the printed specification, but was obtained in electronic for mat directly from WIPO at CC fro.wiso. int/pub/published but segmences.

                                                       The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, named, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, including arthritis, psoriasis, and inflammatory/ulcerative bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antiarteriosclerotic; antianaemic; cytostatic; nootropic; neuroprotective; anti-HIV; anticonvulsant; ophthalmological; antirheumatic; antiarthritic; antidiabetic; antisoriatic; antiinflammatory; cancer; eye disease; arteriosclerosis; ana acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy neurofibromatosis; rheumatoid arthritis; psoriasis; bowel di
